

CM Configurations

Litify Implementation Case Studies

SUMMARY

Litify is built for standard Personal Injury workflows — so when a firm's practice area doesn't fit that mold, the platform needs custom architecture, not just configuration. The four engagements below show how that gets solved in practice: multi-defendant asbestos litigation, high-volume personal injury intake, government takings grouped by property, and pharmaceutical litigation under court-mandated deadlines. Across 10 end-to-end Litify implementations and 5,570+ hours of delivery, this is the kind of problem I specialize in.

Asbestos Litigation

Defendant Directories, Client Probate, Settlement Distributions

- **Challenge:** Litify is built for standard Personal Injury workflows; Asbestos cases required tracking multiple named Defendants per case, Client Probate for deceased claimants, and multi-party Settlement splits across attorney fees, liens, expenses, and referral fees.
- **Solution:** Built a custom Client Matter structure supporting multiple Defendants with Docrio merge documents for Registered Agent/Defense Counsel correspondence; developed a Fee Split Calculator and a settlement forecasting module using historical Matter data.
- **Outcome:** Made Defendant Settlement data — dates, funds received/outstanding, industry exposure, product liability — searchable via reports and dashboards, with a merge/dedupe tool for tracking Defendant name variants over time.

Personal Injury / Workers' Compensation

Custom Questionnaires, Retainer/Source Metrics, Task Lists

- **Challenge:** Firms needed custom intake questionnaires to determine case eligibility, source-tracking to evaluate referral and marketing effectiveness, and standardized task lists to move accepted Matters through the pre-litigation and litigation stages.
- **Solution:** Built custom Litify Questionnaires and Lightning Web Components for firm-specific intake screening, utility bar tools for quick party/intake creation, custom Matter Plan task lists for PI and Workers' Comp stages, and a DocuSign integration with automated envelope status tracking.
- **Outcome:** Improved Intake team transparency through customized dashboards, surfaced which referral sources drove the most retained cases, and streamlined signature workflows with automated status indicators.

Government Takings

Grouping by Case Number, Property Address Repositories, Settlement Splits

- **Challenge:** Litify handles cases as individual Matters by default, but Government Takings cases require grouping by property location and court case-file number, with settlements split by price per square foot.
- **Solution:** Created a Primary Matter grouping structure to house related Property Locations under a single filing number, linked Matters as “Companions” to share records and fields across the grouping, and built custom Property Location/Address child objects for individual Client Matter tracking.
- **Outcome:** Enabled reportable settlement metrics across grouped Matters, giving the firm visibility into total settlement benefit per Primary Matter grouping.

Pharmaceutical Litigation

Dangerous Drugs / Defective Devices — Variance of Products, Settlements by Percentages, Individual Interview Questionnaires by Product Type

- **Challenge:** Matters needed to be grouped by Pharmaceutical Product for long-term task management under strict, product-specific court-mandated deadlines.
- **Solution:** Developed custom interview questionnaires by Product Type and Facility for the Intake process, and a custom CMO deadline component to track upcoming court-scheduled tasks by product type.
- **Outcome:** Enabled settlement allocation and forecasting by Pharmaceutical type, supporting long-term fee and revenue projections.

LET'S TALK

For a working demo of custom Litify architecture, additional case studies, or to discuss an implementation, migration, or optimization project — reach out at cassidychaplowe@gmail.com or visit cmconfigure.com.
